

Java med webbutveckling

uppgift 1

I started with setting up eclipse and the server runtime environment. In eclipse i made 4 jsp pages including index.jsp and a css file.

In index.jsp, first i wrote code for header and footer then i wrote code for "Form". The form contain 2 fields, NAME and CITIES. Cities names are similar to jsp pages, whichever city you choose in the form you will be redirected to that page.

In Java I set the parameters for the NAME and CITY option in form. Once the name and city in form started working, I wrote an if statement to redirect pages to different pages regarding the city you choose in "form dropdown".

For e.x if a user selects tokyo in the city dropdown menu it will be redirected to tokyo page and the same goes to Berlin.

P.s When a user submits the form i get perfect results on my main page. I get the results: "Welcome Idris, This is Tokyo" but I am getting null instead of the name and city in the redirected pages. Looking forward to learn it in the class.
